Mathematical Foundations of Deep Neural Networks, M1407.001200 E. Ryu Fall 2022

Homework 7 Solutions

Problem 1: The true softmax. Define

$$\nu_{\beta}(x) = \frac{1}{\beta} \log \sum_{i=1}^{n} \exp(\beta x_i).$$

Clearly, $\nu_{\beta} \colon \mathbb{R}^n \to \mathbb{R}$ is differentiable. Show that

- (a) $\nu_{\beta}(x) \to \max\{x_1, \dots, x_n\}$ as $\beta \to \infty$.
- (b) $\nabla \nu_1 = \mu$, where μ is the softmax function.
- (c) If $i_{\max} = \operatorname{argmax}_{1 \leq i \leq n} x_i$ is uniquely defined, then $\nabla \nu_{\beta}(x) \to e_{i_{\max}}$ as $\beta \to \infty$, where $\{e_1, \ldots, e_n\}$ is the standard basis of \mathbb{R}^n .

Remark. The parameter β is referred to as inverse temperature, since $\sum_{i=1}^{n} \exp(\beta x_i)$ is the "partition function" of statistical physics when $\beta = \frac{1}{k_B T}$, k_B is the Boltzmann constant, and T is the temperature. The regime $\beta \to \infty$ is therefore referred to as the low-temperature regime.

Solution. (a) As $\beta \to \infty$, we can use L'Hospital's law. We have

$$\lim_{\beta \to \infty} \nu_{\beta}(x) = \lim_{\beta \to \infty} = \frac{\log \sum_{i=1}^{n} \exp(\beta x_i)}{\beta} = \lim_{\beta \to \infty} \frac{\sum_{i=1}^{n} x_i \exp(\beta x_i)}{\sum_{i=1}^{n} \exp(\beta x_i)}$$

and dividing numerator and denominator as $\exp(\beta \max x_i)$, we can defive that $\lim_{\beta \to \infty} \nu_{\beta}(x) = \max\{x_1, \dots, x_n\}$.

- (b) Easy calculation derives the results.
- (c) We have

$$\nabla \nu_{\beta}(x) = \left(\frac{\exp \beta x_i}{\sum_{i=1}^{n} \exp(\beta x_i)}\right)_i.$$

Therefore,

$$\lim_{\beta \to \infty} \nabla \nu_{\beta}(x) = \lim_{\beta \to \infty} \left(\frac{\exp \beta x_i}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = \lim_{\beta \to \infty} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta (x_i - x_{i_{\max}}))} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta x_i}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta (x_i - x_{i_{\max}})}{\sum_{i=1}^n \exp(\beta x_i)} \right)_i = e_{i_{\max}} \left(\frac{\exp \beta ($$

Problem 2: Are linear layers compute-heavy? In AlexNet, 96% of trainable parameters are in the final linear layers, and only 4% are in the convolutional layers. How many operations do the linear and convolutional layers require in the forward pass? Only count the additions and multiplications of these layers, and do not count the operations necessary for the activation, pooling, dropout, and softmax layers. Use the version of AlexNet defined in counting_params.py. Assume the input image has size $3 \times 227 \times 227$.

Remark. A more complete investigation in the spirit of this problem would count the arithmetic operations of a gradient computation via a backward pass. For the sake of simplicity, we only consider the forward pass.

Solution. For the convolutional layer, suppose the input has shape $c_{\rm in} \times h_{\rm in}^2$, kernel size is k, and the output has shape $c_{\rm out} \times h_{\rm out}^2$. The number of multiplications and additions are (number of output positions)×(operations per output position), which is

$$(c_{\text{out}} \times h_{\text{out}}^2) \times (c_{\text{in}} \times k^2).$$

For the linear layer, suppose the input has length $c_{\rm in}$ and the output has length $c_{\rm out}$. The number of multiplications and additions are

$$c_{\rm in} \times c_{\rm out}$$
.

The number of multiplications and additions for each layer are:

layer	input size		kernel size	output size		// on anations	
	$c_{ m in}$	$h_{ m in}$	kernei size	$c_{ m out}$	$h_{ m out}$	#operations	
conv1	3	227	11	64	55	$(64 \times 55^2) \times (3 \times 11^2)$	= 70,276,800
pool1	64	55	3	64	27		
conv2	64	27	5	192	27	$(192 \times 27^2) \times (64 \times 5^2)$	=223,948,800
pool2	192	27	3	192	13		
conv3	192	13	3	384	13	$(384 \times 13^2) \times (192 \times 3^2)$	= 112,140,288
conv4	384	13	3	256	13	$(256 \times 13^2) \times (384 \times 3^2)$	= 149,520,384
conv5	256	13	3	256	13	$(256 \times 13^2) \times (256 \times 3^2)$	=99,680,256
pool5	256	13	3	256	6		
linear1	9,216			4,096		$9,216 \times 4,096$	=37,748,736
linear2	4,096			4,096		$4,096 \times 4,096$	= 16,777,216
linear3	4,096			1,000		$4,096 \times 1,000$	=4,096,000

The convolutional layers require 655,566,528 multiplications and additions, which consume 91.79% of total operations. The linear layers require 58,621,952 multiplications and additions, which consume 8.21% of total operations. \blacksquare

Problem 3: Removing BN after training. During training, the addition of batch norm adds additional operations that were otherwise not present and therefore increases the computational cost per iteration. During testing, however, the effect of batch normalization can be combined with the preceding convolutional or linear layer so that no additional computational cost is incurred. Download the starter code bn_remove.py and the save file smallNetSaved and carry out the removal of the batchnorm layers. Specifically, load the pre-trained smallNetTrain model and set the weights and parameters of smallNetTest so that the two models produce exactly the same outputs on the test set.

Solution. See bn_remove_sol.py. ■

Problem 4: Backprop with convolutions. Consider 1D convolutions with single input and output channels, stride 1, and padding 0. Let w_1, \ldots, w_L be convolutional filters with sizes f_1, \ldots, f_L . Let $A_{w_\ell} \in \mathbb{R}^{n_\ell \times n_{\ell-1}}$, where $n_\ell = n_{\ell-1} - f_\ell + 1$, be the matrix representing convolution with w_ℓ , i.e., multiplication by A_{w_ℓ} is equivalent to convolution with w_ℓ , for $\ell = 1, \ldots, L$. Let $\sigma \colon \mathbb{R} \to \mathbb{R}$ be a differentiable activation function. Consider the convolutional neural network

$$y_{L} = A_{w_{L}} y_{L-1} + b_{L} \mathbf{1}_{n_{L}}$$

$$y_{L-1} = \sigma(A_{w_{L-1}} y_{L-2} + b_{L-1} \mathbf{1}_{n_{L-1}})$$

$$\vdots$$

$$y_{2} = \sigma(A_{w_{2}} y_{1} + b_{2} \mathbf{1}_{n_{2}})$$

$$y_{1} = \sigma(A_{w_{1}} x + b_{1} \mathbf{1}_{n_{1}}),$$

where $x \in \mathbb{R}^{n_0}$, $b_{\ell} \in \mathbb{R}$, $\mathbf{1}_{n_{\ell}} \in \mathbb{R}^{n_{\ell}}$ is the vector with all entries being 1, and $n_L = 1$. For notational convenience, define $y_0 = x$.

(a) Define

$$v_L = 1, \qquad v_\ell = \frac{\partial y_L}{\partial y_\ell} \operatorname{diag} \left(\sigma'(A_{w_\ell} y_{\ell-1} + b_\ell \mathbf{1}_{n_\ell}) \right) \qquad \text{for } \ell = 1, \dots, L-1.$$

Let $\mathcal{C}_{v_\ell^\mathsf{T}}$ be the 1D convolutional operator defined by interpreting $v_\ell^\mathsf{T} \in \mathbb{R}^{n_\ell}$ as a convolutional filter for $\ell = 1, \dots, L$. Show that

$$\frac{\partial y_L}{\partial y_{L-1}} = A_{w_L}, \qquad \frac{\partial y_\ell}{\partial y_{\ell-1}} = \operatorname{diag}\left(\sigma'(A_{w_\ell}y_{\ell-1} + b_\ell \mathbf{1}_{n_\ell})\right) A_{w_\ell} \qquad \text{for } \ell = 2, \dots, L-1$$

$$\frac{\partial y_L}{\partial w_\ell} = (C_{v_\ell^\intercal} y_{\ell-1})^\intercal \qquad \text{for } \ell = 1, \dots, L$$

$$\frac{\partial y_L}{\partial b_\ell} = v_\ell \mathbf{1}_{n_\ell} \qquad \text{for } \ell = 1, \dots, L.$$

(b) As discussed in homework 1, forming the full matrix $A_{w_{\ell}}$ is wasteful and should be avoided. Describe how matrix-vector or vector-matrix products with respect to A_{w_i} or $A_{w_i}^{\mathsf{T}}$ should be used in the forward pass and backpropagation.

Clarification. A matrix-vector product $A_{w_i}v$ should be computed by performing convolution. A vector-matrix product $u^{\dagger}A_{w_i}=(A_{w_i}^{\dagger}u)^{\dagger}$ should be computed by performing transpose-convolution, which was discussed in homework 1.

Solution.

(a) Actually, since convolution with w_{ℓ} is equal to multiplication by $A_{w_{\ell}}$, differentiation by b_{ℓ} or y_i is essentially same as in the case of problem 6, homework 4. So trivially,

$$\frac{\partial y_L}{\partial y_{L-1}} = A_{w_L}, \qquad \frac{\partial y_\ell}{\partial b_\ell} = \operatorname{diag}\left(\sigma'(A_{w_\ell}y_{\ell-1} + b_\ell \mathbf{1}_{n_\ell})\right) \mathbf{1}_{n_\ell}
\frac{\partial y_\ell}{\partial y_{\ell-1}} = \operatorname{diag}\left(\sigma'(A_{w_\ell}y_{\ell-1} + b_\ell \mathbf{1}_{n_\ell})\right) A_{w_\ell},$$

for all $\ell = 1, \ldots, L$ and

$$\frac{\partial y_L}{\partial b_\ell} = \frac{\partial y_L}{\partial y_\ell} \operatorname{diag} \left(\sigma' (A_\ell y_{\ell-1} + b_\ell \mathbf{1}_{n_\ell}) \right) \mathbf{1}_{n_\ell} = v_\ell \mathbf{1}_{n_\ell} \qquad \frac{\partial y_L}{\partial w_\ell} = \frac{\partial y_L}{\partial y_\ell} \frac{\partial y_\ell}{\partial w_\ell}$$

The remaining thing is to compute $\frac{\partial y_{\ell}}{\partial w_{\ell}}$ Like in the problem 6, homework 4,

$$y_{\ell} = \sigma(A_{w_{\ell}}y_{\ell-1} + b_{\ell}\mathbf{1}_{n_{\ell}})$$

$$= \begin{bmatrix} \vdots \\ \sigma((A_{w_{\ell}}y_{\ell-1})_{i} + b_{\ell}) \\ \vdots \end{bmatrix}$$

$$= \begin{bmatrix} \vdots \\ \sigma(\Sigma_{j=i+1}^{i+f_{\ell}}(w_{\ell})_{j}(y_{\ell-1})_{j} + b_{\ell}) \\ \vdots \end{bmatrix}$$

$$(1)$$

So $\frac{\partial y_{\ell}}{\partial w_{\ell}}$ is

$$\frac{\partial y_{\ell}}{\partial (w_{\ell})_{k}} = \begin{bmatrix}
\sigma'((A_{w_{\ell}}y_{\ell-1})_{1} + b_{\ell}) \cdot (y_{\ell-1})_{k} \\
\vdots \\
\sigma'((A_{w_{\ell}}y_{\ell-1})_{i} + b_{\ell}) \cdot (y_{\ell-1})_{i+k} \\
\vdots \\
\sigma'((A_{w_{\ell}}y_{\ell-1})_{n_{\ell}} + b_{\ell}) \cdot (y_{\ell-1})_{n_{\ell}-1+k}
\end{bmatrix}$$

$$= \operatorname{diag}\left(\sigma'((A_{w_{\ell}}y_{\ell-1} + b_{\ell}\mathbf{1}_{n_{\ell}}))\right) \begin{bmatrix}
(y_{\ell-1})_{k} \\
\vdots \\
(y_{\ell-1})_{i+k} \\
\vdots \\
(y_{\ell-1})_{n_{\ell}-1+k}
\end{bmatrix}$$
(2)

Thus,

hus,
$$\frac{\partial y_{\ell}}{\partial w_{\ell}} = \operatorname{diag} \left(\sigma'((A_{w_{\ell}} y_{\ell-1} + b_{\ell} \mathbf{1}_{n_{\ell}})) \right) \begin{bmatrix} (y_{\ell-1})_{1} & (y_{\ell-1})_{2} & \cdots & (y_{\ell-1})_{f_{\ell}} \\ \vdots & & & & \\ (y_{\ell-1})_{i+1} & (y_{\ell-1})_{i+2} & \cdots & (y_{\ell-1})_{i+f_{\ell}} \\ \vdots & & & & \\ (y_{\ell-1})_{n_{\ell}} & (y_{\ell-1})_{n_{\ell}+1} & \cdots & (y_{\ell-1})_{n_{\ell}-1+f_{\ell}} \end{bmatrix}$$

$$\frac{\partial y_{L}}{\partial w_{\ell}} = v_{\ell} \begin{bmatrix} (y_{\ell-1})_{1} & (y_{\ell-1})_{2} & \cdots & (y_{\ell-1})_{f_{\ell}} \\ \vdots & & & & \\ (y_{\ell-1})_{i+1} & (y_{\ell-1})_{i+2} & \cdots & (y_{\ell-1})_{i+f_{\ell}} \\ \vdots & & & & \\ (y_{\ell-1})_{n_{\ell}} & (y_{\ell-1})_{n_{\ell}+1} & \cdots & (y_{\ell-1})_{n_{\ell}-1+f_{\ell}} \end{bmatrix}$$

Notice that this is exactly the transpose of the convolution of $y_{\ell-1}$ with the transpose of v_{ℓ}^{T}

(b) Since they only arise in computing gradient with chain rule, it should be especially taken care of when performing backward pass. So in forward pass, we normally compute convolution, and in the backward pass, we only save the information that these are matrices that correspond to convolution, and as we go further and further, when these matrices are multiplied with lower layer gradients, we compute convolution with those gradients.

Problem 5: Larger network in network. Consider the convolutional neural network Net1 designed to classify the CIFAR10 dataset. Use the starter code LNiN.py.

```
class Net1(nn.Module):
  def __init__(self, num_classes=10):
    super(Net1, self).__init__()
    self.features = nn.Sequential(
      nn.Conv2d(3, 64, kernel_size=7, stride=1),
      nn.ReLU(),
      nn.Conv2d(64, 192, kernel_size=3, stride=1),
      nn.ReLU(),
      nn.Conv2d(192, 384, kernel_size=3, stride=1),
      nn.ReLU(),
      nn.Conv2d(384, 256, kernel_size=3, stride=1),
      nn.ReLU(),
      nn.Conv2d(256, 256, kernel_size=3, stride=1),
    self.classifier = nn.Sequential(
      nn.Linear(256 * 18 * 18, 4096),
      nn.ReLU(),
      nn.Linear (4096, 4096),
      nn.ReLU(),
      nn.Linear (4096, num_classes)
  def forward(self, x):
    x = self.features(x)
    x = torch.flatten(x, 1)
    x = self.classifier(x)
    return x
```

(a) Consider Net2, which replaces the fully-connected layers of Net1 with convolutional layers. Implement Net2 and the weight initialization function so that Net1 and Net2 are equivalent in the following sense: When the parameters of Net1 are appropriately copied over, Net2 produces exactly the same output as Net1 for inputs of size $B \times 3 \times 32 \times 32$.

```
class Net2(nn.Module):
    def __init__(self, num_classes=10):
        super(Net2, self).__init__()
        self.features = nn.Sequential(
            nn.Conv2d(3, 64, kernel_size=7, stride=1),
            nn.ReLU(),
            nn.Conv2d(64, 192, kernel_size=3, stride=1),
            nn.ReLU(),
            nn.Conv2d(192, 384, kernel_size=3, stride=1),
            nn.ReLU(),
             nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
            nn.ReLU(),
```

```
